EU AI Act Risk Assessment — Zienswijzer

Risk classification: Limited risk. **Date:** 2026-06-05 **Vendor:** Gradient.

1. AI system description

Zienswijzer uses a single AI component: a zero-shot text classifier (`cross-encoder/nli-deberta-v3-small`, via HuggingFace `transformers`) that labels stakeholder replies as "agrees to publish" or "objects to publication". The model runs locally inside the deployment container; no inference data leaves the cluster.

2. Intended use

Assistive triage for human WOO case handlers. Output is a suggestion with a confidence score; a human makes the publication decision.

3. Why "limited risk"

- Not a prohibited practice (Art. 5).
- Not high-risk (Annex III): it does not determine access to essential services, is not used in law enforcement decisioning, and has no legal effect on persons.
- It is an assistive classification tool with human oversight → limited risk, subject to transparency obligations (Art. 50).

4. Transparency (Art. 50)

Users are informed that classification is AI-generated. Labels and confidence scores are surfaced in the UI; the candidate labels are fixed and documented.

5. Human oversight

Every classification is reviewable and overridable by the case handler. No automated publication occurs based solely on the model output.

6. Data governance & residency

Inference runs in-cluster on EU infrastructure (data_residency: EU). No training on user data is performed by this deployment. The base model is a fixed, pre-trained, open model.

7. Robustness & monitoring

The classifier is loaded lazily and isolated to the `/classification` endpoints; failures are surfaced as errors and do not affect core case management.
